Annex D — Closeable issues + conformance tests v1

Closeable issues + conformance tests (from ANCR 27560 case study) Builing on ANCR TPI-R v1 - for valid digital-id consent.

Closeable issues to close in ISO/IEC CD 27560:2026

1. **Receipt-as-acknowledgement ambiguity**
   - Risk: “receipt” collapses into a controller acknowledgement/log.
   - Closeable fix: define receipt as reciprocal, issued/provided evidence usable by the PII principal.
2. **Record/receipt inversion (controller log labelled receipt)**
   - Risk: internal recordkeeping exports qualify as “receipt” without reciprocity.
   - Closeable fix: require issuance/provision semantics and minimum evidence fields.
3. **No testable sequencing requirement**

- Risk: “notice-first” cannot be verified; records can be written after collection/use.
- Closeable fix: add a testable notice-first sequencing requirement.

4. Identifier-first rights drift via `pii_principal_id`
   - Risk: stable header identifier becomes the rights access key, enabling linkability/breach.
   - Closeable fix: allow/encourage scoped references for rights/withdrawal; prohibit treating `pii_principal_id` as a public rights access mechanism.
5. **Withdrawal portability failure**
   - Risk: withdrawal does not propagate across systems without identifier correlation.
   - Closeable fix: define portable, revocable references (tokens) for withdrawal propagation.

Conformance test signals (pass/fail)

- Pass: Stage 1 notice evidence is obtainable without providing a stable principal identifier.

- Pass: receipts are issued/provided as portable evidence (not only controller-side logs).
- Pass: receipt artefacts reference a specific notice state and prove order (notice → choice → processing).
- Pass: withdrawal/objection can be initiated using a scoped receipt/token reference (not a global principal ID).
- Pass: material notice changes are represented as an inspectable state history (event log) and are referenceable from receipts.
